Stem Bearing	PEEK	PEEK	Nylon	UHMWPE
Default Suffix	24	01	24	

TOP ENTRY BALL VALVES

Seat Materials and Seat Designs

SEAT CODE "G" (PCTFE)

Polychlorotrifluoroethylene is typically used in cryogenic applications. High resistance to inorganic corrosive liquids, including oxidizing acids. Resistant to most organic solvents except some highly halogenated and aromatic materials. (Figure 1) See Pressure-Temperature Chart 2, page 10.

SEAT CODE "L" (TFM MULTISEAL)

API-607 fire-safe design.

This seat design has been successfully tested to the requirements of API 607. The Multiseal seat is fully confined by a metallic seat holder which provides a secondary seal in the event of the loss of the primary TFM seal during a fire. The torque characteristics will be the same as in the #M seats. (Figure 3) See Pressure-Temperature Chart 1, page 10.

SEAT CODE "M" (TFM MULTISEAL)

Apollo's Multiseal is a modified PolyTetraFluoroEthylene (PTFE) that maintains the exceptional chemical resistance and heat resistance properties of conventional PTFE. (Figure 1) See Pressure-Temperature Chart 1, page 10.

SEAT CODE "C" (PFA)

Perfluoroalkoxy seats withstand the effects of polymeric monomers such as butadiene and styrene. (Figure 2) See Pressure-Temperature Chart 1, page 10.

SEAT CODE "5" (55% BRONZE / 5% MOLY BRTFE)

Specifically intended for steam applications. Also applicable to abrasive and throttling applications because of the heavy loading of reinforcing materials and the presence of the inner ring. However, chemical compatibility may be a limiting factor in the application of this seat. (Figure 2) See Pressure-Temperature Chart 3, page 11.

SEAT CODE "D" (60% STAINLESS STEEL SRTFE)

Intended for abrasive and throttling applications because of the heavy loading of reinforcing materials and the completely confined seat. (Figure 2) See Pressure-Temperature Chart 1, page 10.

SEAT CODE "6" (UHMWPE)

Ultra High Molecular Weight Polyethylene offers good abrasion resistance making it suitable for use in high solids or slurry applications. These seats are completely confined by a metallic seat holder enhancing their performance in abrasive services. This seat is frequently specified in services where fluorine off-gasing in even the slightest amounts is objectionable. Examples of these services are food, tobacco processing, and nuclear services. (Figure 2) See Pressure-Temperature Chart 4, page 11.

Figure 1
Seat Design 1

Figure 2
Seat Design 2

TOP ENTRY BALL VALVES

Seat Materials and Seat Designs

Figure 3
Seat Design 3

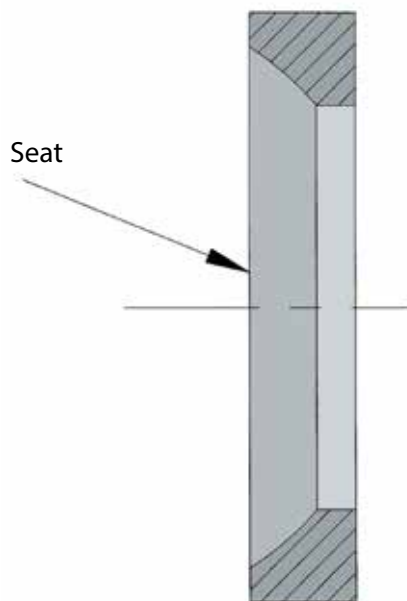

Figure 4
Seat Design 4

SEAT CODE "U" (UHMWPE)

Exhibits the same characteristics as the #6 seat with the exception that it utilizes the inner seat ring to enhance performance in abrasive services. UHMWPE should be used with caution in the presence of solvents, and the operating torque can be expected to be 30% higher than that of the PTFE based seat materials. (Figure 1) See Pressure-Temperature Chart 4, page 11.

SEAT CODE "8" (PEEK)

PEEK (PolyEtherEtherKetone) offers a high strength alternative to RPTFE, resistant to creep and cold flow. This seat offers good abrasion resistance. Higher in cost, this material offers similar chemical resistance to PTFE but should be checked on application. Operating torque tend to be 40% higher than RPTFE. Ball stop recommended. (Figure 2) See Pressure-Temperature Chart 5, page 12.

SEAT CODE "B" (CARBON REINFORCED PEEK)

Carbon Reinforced PEEK provides improved abrasion resistance when compared to the unfilled variety. Higher in cost, this material offers a broader temperature range than PTFE with similar chemical resistance but should be checked on application. Operating torque tends to be 40% higher than PTFE. Ball stop recommended. (Figure 2) See Pressure-Temperature Chart 5, page 12.

SEAT CODE "4" (CARBON GRAPHITE)

Designed for high temperature applications. A ball stop is required in applications above 500°F. Maximum service temperature is limited to 750°F in oxidizing applications. This seat like all rigid seat materials does not necessarily provide "bubble tight" shut-off. Most test standards have allowable leakage rates or list "classes" of shut-off for this type of seat. Be aware of the system design requirements when specifying this or any rigid seat. Ball stop recommended. (Figure 1) See Pressure-Temperature Chart 6, page 12.

SEAT CODE "H" (HIGH TEMPERATURE GRAPHITE)

Designed for very high temperature applications. A ball stop is required in applications above 500°F. Maximum service temperature is limited to 1000°F. This seat like other rigid seat materials does not provide "bubble tight" shut-off. This seat is not as abrasion resistant as the #4 version. Be aware of the system design requirements when specifying this or any rigid seat. Ball stop recommended. (Figure 1) See Pressure-Temperature Chart 6, page 12.

SEAT CODE "9" (CERAMIC)

Working in conjunction with a ceramic ball, this seat outperforms all other materials in throttling and abrasive applications. It possesses excellent chemical resistance. A ball stop is recommended for all applications. This seat like all rigid seat materials does not necessarily provide "bubble tight" shut-off. Most test standards have allowable leakage rates or list "classes" of shut-off for this type of seat. Be aware of the system design requirements when specifying this or any rigid seat. (Figure 4) See Pressure-Temperature Chart 7, page 13.

- 1 Ratings per ASME B16.34 - 2009
- 2 WCB: Upon prolonged exposure to temperatures above 800°F (425°C), the carbide phase of steel may be converted to graphite. Permissible, but not recommended for prolonged usage above 800°F (425°C)
- 3 CF8M: At temperatures above 1000°F (538°C), use only when the carbon content is 0.04% or higher.
- 4 CF8M Class 150: Flanged End valve ratings terminate at 1000°F (538°C)

TOP ENTRY BALL VALVES

Standard Bonnets

STANDARD BONNET ISO 5211 Mounting Pad

The valve's seat material "code" in the Product Numbering System determines the default stem seal material (default is either PTFE V-Rings or flexible graphite rings).

Note: To meet a wide range of application requirements, a variety of materials are offered. See options in the "How to Specify" section.

PTFE V-RING STEM SEALS

- Extremely low coefficient of friction
- Molded V-shaped rings are "spring-loaded" and self adjusting.
- Provides very good stem seal performance

Enhancement – Live Loaded Packing (add suffix to product number)

"-76" Suffix – Live loaded valve with handle or lever.

"-77" Suffix – Live loaded valve with actuator or manual gear.

Live-loaded, V-ring packing assures long maintenance-free operation by maintaining a constant packing force without over-compression. Corrosion-resistant stainless steel conical washers store compressing energy; consequently, the valve can be cycled more without stem seal adjustments

FLEXIBLE GRAPHITE RING STEM SEALS

- Die Formed Rings

Enhancement – Low Emissions

"EP" Suffix – Cup and cone graphite rings (V-shaped) are often specified for applications where fugitive emissions must be controlled.

Enhancement – Live Loaded Packing

"-76" Suffix – Live loaded valve with handle or lever.

"-77" Suffix – Live loaded valve with actuator or manual gear.

TOP ENTRY BALL VALVES

Extended Bonnets

EXTENDED BONNET
(Add "-70" Suffix)

12" DN 300	10" (254)	12.5" (318)		

ADVANTAGES:

- Extended bonnets provide excellent performance in higher temperature or semi cryogenic applications.
 - The extended bonnet design moves the stem seals further away from the process flow's temperature, and the stem seals' temperature is closer to ambient temperature.
- Extended bonnets move the packing adjustment at least 4"; therefore, installed insulation typically will not need to be disturbed to adjust the stem packing.
 - If and when stem leakage occurs, it can be immediately observed and corrective action taken without insulation removal.
- A valuable feature of the Extended Bonnet is that it is field retrofitable.
 - In addition to being able to order valves with several bonnet styles direct from the factory, pre-assembled kits are available with the stem, bonnet, packing, gland, plate and nuts assembled together and properly torqued for dependable performance. Contact your local Apollo Representative for kit part numbers for any specific valve or application.

TOP ENTRY BALL VALVES

Double Packed Bonnets

**DOUBLE PACKED
BONNET**
(Add "-90" Suffix)

Apollo recommends also specifying live-loading with the "-90" option.

**DOUBLE PACKED
BONNET WITH PORT**
(Add "-9P" Suffix)

Apollo recommends also specifying live-loading with the "-9P" option.

The standard Apollo Top Entry Valve bonnet with PTFE V-Rings or Graphite V-Rings ("-EP") provide exceptional fugitive emission performance. See *Standard Bonnet Configuration*.

In conditions where double packed shaft sealing systems are required, Apollo also offers the "-90" and "-9P" sealing systems.

Apollo's Double Packed Bonnets ("-90" and "-9P"):

- Designed and tested to keep fugitive emissions below 100 parts per million volume (ppmv) in your application for tens of thousands of cycles.
- Installs easily on existing valves or can be purchased with new valves.
- Helps seal your process to conserve valuable process fluid while protecting the environment against the emission of hazardous or polluting fluids.
- Longer life and improved reliability of Apollo Double Packed Bonnet systems reduce maintenance cost and downtime.
